### Bye-Bye Head Lice conditioner spray

## Here's how I can help you!

As a parent, you know only too well that your child's hair and scalp can often have tiny and very stubborn guests to stay – head lice. So Halykoo developed me to help you to fight them – Bye-Bye Head Lice Conditioner Spray is a treatment for eliminating head lice and their eggs easily!

What's my job? First of all, to suffocate the eggs and head lice to make them easier to remove, while protecting your child's delicate scalp at the same time.

Next I help to untangle his hair and get rid of any knots. So taking care of head lice and their eggs becomes quick and painless, thanks also to my convenient '2-in-1' comb, the ideal way to send those unwanted guests on their way, getting rid of them right at the roots!

## Before you use me, let me explain what I'm made of...

Do you know why I work so well? Because of my active ingredients! Working together, their triple action is tough when needed, but also gentle on your child's skin and hair.

Dimethicone suffocates the eggs and head lice, and along with apple vinegar, makes it easier to remove them. Meanwhile, thanks to its polysaccharides, aloe vera creates a layer on the scalp which helps to protect from any skin irritation. And then there's organically-grown apricot oil that pampers the hair while protecting and nourishing it, making it soft and silky. And that's not all! Did you see my special 'weapons'? One is the professional nozzle that lets you apply me effectively in exactly the right places, only where I'm needed. The other one is the '2-in-1' comb. You can use its rounded teeth to spread me evenly all over, and then carefully remove these unwanted guests with the flexible fine blue teeth.

And one last thing! Did you know that my formula has been developed and is suitable for use on even the most delicate skin? Which is exactly why I'm suitable for children 12 months of age and up.

## ...the best place to store me...

Store me between 8°C and 30°C in a cool dry cabinet, away from heat, sunlight... and curious children!

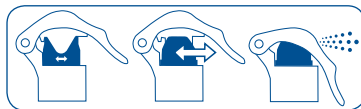

## ...what you should check before using me!

First of all, check my use-by date which refers to the intact product that's been stored correctly. Don't use me beyond that date or 6 months after opening. Make sure that my packaging isn't damaged, and that the nozzle hasn't already been activated. Before using me, please read this illustrated leaflet carefully and keep it for future reference.

## Here's how to get the best out of me!

Shake me well before use, then turn my safety catch to release the nozzle.

Holding me 4-5 cm away from your child's head, spray me onto dry hair until the hair roots and scalp are thoroughly soaked. Carefully massage into the scalp, especially around the back of the neck and the area behind the ears.

Spray me again on the whole length of the hair, making sure I'm distributed evenly using the rounded teeth of the comb. After the end of the application, leave me on for at least 15 minutes, or longer to increase my effectiveness, but not for more than 1 hour.

Then, with the flexible blue teeth, carefully comb through from the roots to the ends of the hair to remove the head lice and their eggs, making sure to clean the comb each time to avoid further infestation.

Finished? Good. Now wash your child's hair with your usual shampoo, turn my safety catch back to the 'off' position so that I'll be stored properly and there are no accidental leaks. Repeat the application after 7 days, to ensure that the life cycle of the head lice is completely broken.

There's enough of me for 2 treatments, depending on the length of your child's hair. Keep in mind that head lice won't become resistant to my formula, so you can use me as often as necessary.

## ...lastly, just a few things to be aware of...!

First of all, you need to know that I'm suitable for use for children 12 months of age and older. Make sure I'm always applied by an adult and that you don't leave your child alone during treatment.

Don't use me on broken skin, and avoid contact with eyes, nose, mouth and mucous membranes. In the event of contact with eyes, rinse them repeatedly with running water. Do not inhale me, and in case of swallowing, consult your doctor immediately.

The scalp might become itchy or slightly irritated during treatment. In case of any skin reaction or side effect, stop using me immediately, rinse carefully and consult your doctor.

I do not contain neurotoxins, chemical insecticides or antiparasitics, nor parabens, phenoxyethanol, colouring agents or allergens.

Don't use me if you know or suspect your child is hypersensitive to any of my components, and ask your doctor's advice before using me in concomitance with other drugs or medical devices. Don't spray me if my bottle is damaged or if my nozzle has already been activated.

And finally... two more things! Keep in mind that I am a medical device treatment strictly for external use on the hair and scalp, and that I haven't been tested for continuous and long-term use. Always follow my instructions for use to reduce the risk of side effects.

**INGREDIENTS:** WATER, DIMETHICONE, GLYCERYL STEARATE, ETHYL HEXYL PALMITATE, CETEARETH-20, PEG-33 AND PEG-8 DIMETHICONE AND PEG-14, BETAINE, PRUNUS ARMENIACA (APRICOT) KERNEL OIL, ACETUM (VINEGAR), PARFUM, 1,2 HEXANEDIOL, ETHYL HEXYL GLYCERIN, CAPRYLYL GLYCOL, ALOE BARBADENSIS LEAF JUICE, XANTHAN GUM, CETEARYL ALCOHOL, CETYL PALMITATE, TROPOLONE, DISODIUM EDTA, PENTAERYTHRITYL TETRA-DI-T-BUTYL HYDROXYHYDROCINNAMATE, LACTIC ACID.

Research with babies in mind.

**Solutions designed specifically to share the journey with you and your child through each stage of his or her development. Because the best way to help them thrive is to keep it simple, use common sense, and also take a few precautions.**

Looking after children isn't just about nursing them. It also means understanding their needs, listening to what's important to their parents, and following the advice of paediatricians, as well as providing solutions that put their well-being and their parents' peace of mind first. It means researching a myriad of ingredients to find the ones that are best-suited to their health needs and to ensure that treatment is a pleasant experience for them. It also means choosing solutions that are specifically designed for each phase of their development. Because seeing smiles on the faces of children, and on those of the people who care for them as they grow, are the best possible reward for Halykoo.

### DERMA

Skin is our first point of contact with the world around us. In the first 12-14 months of your child's life, their skin is about half the thickness of yours, so great care needs to be taken to protect it. Halykoo's Derma line is the first range of products designed to care effectively for all the needs of your child's skin. Redness, inflammation, chapping, insect bites, and small injuries can be causes of concern on a daily basis, and Halykoo Derma has the answer to all of them.

### AERA

There are a variety of viruses that can cause the common cold. And wind, cold weather or badly-ventilated and over-heated rooms can irritate the throat. And as the nose and mouth can't be covered up, they're always vulnerable to external threats. Halykoo's Aera range of products have been specifically created to deal with the effects of respiratory infections, helping to fight off sore throats, coughs, cold and fever.

### SENSIA

Drinking from a used glass, rubbing dirty hands in their eyes or putting a leaf from the park in their mouth: these are just a few of the things that children do without giving it a moment's thought. A child's immune system is still developing, so the result can be a mouth or eye infection. Whether it's mouth ulcers, oral thrush or conjunctivitis, Halykoo's Sensia range of specifically designed products has the solution.

### NUTRA

School, sports, extra-curricular activities – children have increasingly busy days, and the change of seasons can also mean tiredness and loss of appetite. Children are also susceptible to stomach flu caused by viruses, bacteria and parasites. Halykoo's Nutra food supplements, including probiotic products, can help your child make the most of their energy, and ensure that the intestinal flora in their stomach is restored.

### DERMA

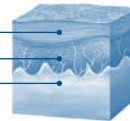

## Your skin and your baby's skin

Mums and Dads, your body's skin (or epidermis) is pretty tough. Its outside layer covers an average area of 2 square metres and weighs around 2.5 kilograms. It's constantly regenerating: in one month, your body completely replaces every skin cell, and you shed around 45 kilograms of it over a lifetime. The thickness of the skin varies from less than 1 millimetre thick on the eyelids to 4 millimetres thick on the heels of your feet.

However, your child's skin is thinner than yours. In the first 12-14 months of a baby's life, it's about half the thickness, so more care is required to protect it properly. As with all other physiological functions, even a baby's skin has to be "trained" to prepare it for its life ahead. For example, when the temperature allows, removing excess layers of clothing and letting the skin breathe helps it to find its balance and fulfil its many functions, protective and otherwise.

- dermis \_\_\_\_\_
- hypodermis \_\_\_\_\_

### Fresh air

During pregnancy, the baby's skin is protected in the amniotic fluid by a layer of sebum and skin called the vernix caseosa, a white film that disappears shortly after birth. Sebum production stops almost instantly, which explains why a baby's skin can be quite dry in the first few months. As melanine production has not yet started, and since the skin is very thin, an external substance such as the artificial colouring in a felt-tip pen can be more dangerous for a little one than for an older child. Of course, even when your child is no longer an infant, it's important at any age to avoid prolonged exposure to strong sunlight and wind. That aside, fresh air can only do a world of good.

## The scalp - where head lice feel right at home

Heat, moisture, darkness... the scalp is the perfect hiding place for a tiny and annoying parasite called the head louse. It's a minuscule insect that's only transferred through direct contact, and can affect anyone, regardless of age or state of hygiene.

Why does it love children so much? That's easy! It's because the skin of little ones produces a smaller amount of lower quality fats and oils than that of adults, so it's an ideal habitat for head lice to survive in for up to 30 days, and their eggs for more than 2 weeks.

But not to worry! There are specially designed treatments available to get rid of them just as easily as they appeared.

However, once they're gone, you must also remember to disinfect clothing, bedding, hats and scarves... anything that could have been in contact with them. Clothing only needs a 60° wash – soak combs and brushes in rubbing alcohol or a lice-destroying agent (pelliculicide).
